

Mini Home Cinema Projector

There is something extra special about watching sporting events, movies and TV shows on a big screen, but it is even better when you can enjoy all the benefits of the big screen whilst surrounded by all your home comforts.

What are mini projectors used for?

A mini home projector can be used both indoors and outside to view everything from slideshows of your treasured photographs to the latest episode of your favourite television drama. So, you can say goodbye to being forced to watch shows or movies on a device with a small screen, ensuring you will never miss out on even the smallest details.

Can you watch movies on a mini projector?

A portable projector can be used to view a vast array of different types of media, including movies and TV shows. Projectors are equipped with numerous connective ports to provide maximum versatility, such as SD card ports, USB ports and VGA ports. They are also programmed to support a selection of different media formats, including MP4, JPEG, and MP3.

You may need to obtain certain cable adaptors to watch your favourite content, however, watching content from streaming services such as Netflix can be as easy as loading up what you want to watch and casting it to your projector.

Are the mini projectors any good?

You no longer need to commit to investing in a bulky, difficult-to-store projector to create your own home cinema experience. As well as being compact, a mini home cinema projector is also a much more affordable option that won't leave you compromising on quality.

It is important to look for a model that is capable of offering the right level of brightness for your space. As a general guide, projectors placed in dark rooms should have a brightness level of at least 500 lumens.

What can I do with a mini projector?

You can use a mini projector in a variety of different ways, including creating your own home cinema. Compact home projectors can also be used to display photo slide shows, which can give special celebrations or events an extra special personalised touch.

If you want to watch TV shows or movies on a bigger screen, the integrated aux-out ports also allow you to connect headphones or speakers to your projector, which will help you to create an immersive viewing experience with ease.

What mini projector will play Netflix?

Most mini projectors can be used to play Netflix content. Typically, the easiest way to do this from an iPhone or iPad is to invest in a Lightning-to-USB adaptor cable. Once your iPhone is plugged into your projector, your phone's screen will be mirrored to the projector and you can simply open the Netflix app to start watching.

What is the difference between a mini projector and a regular projector?

The only real difference separating mini projectors from larger, standard projectors is size. If portability and versatility is an important factor for you, a smaller smartphone projector is likely to be well suited to your needs. The compact size of a mini projector means that it can be packed away for safe keeping when not in use, positioned in an array of locations around your home, and even taken on holiday or to a friend's house with ease.

Although mini projectors generally aren't able to deliver the crisp image projection offered by high-end large projectors, you will find that the quality is more than suitable for transforming your living room or snug into a comfortable home cinema.
